

# Bell Activity Page 69

- What are the main factors that effect the growth of a population?

A large empty rectangular box with a black border, intended for the student to write their answer to the question. The box is positioned below the question and occupies the lower-left portion of the page.

# Objectives: I will be able to...

- Identify causes and effects of rapid population growth.
- Recognize ways to measure population, including birth rate and death rate.
- Explore population growth through a web quest activity.
- Analyze population growth's effects on natural resources.

# Population Dynamics

# Populations

- Population: A group of organisms of the same species living in the same place at the same time.
- Population Size: The number of individuals
- Population Density: The number of individuals in a certain space.

# POPULATION GROWTH

- Population controlled by...

- Births
- Deaths
- Immigration
- Emigration

- Formula:

$$\text{Population } \Delta = (\text{Births} + \text{Immigration}) - (\text{Deaths} + \text{Emigration})$$

# POPULATION OF THE EARTH

Number of people living worldwide since 1700 in billions

Source: United Nations World Population Prospects, Deutsche Stiftung Weltbevölkerung

# Change in Population Example

- Starting population = 5,000
  - Births = 500
  - Deaths = 200
  - Immigration = 50
  - Emigration = 25
- What is the ending population?

# Population Density

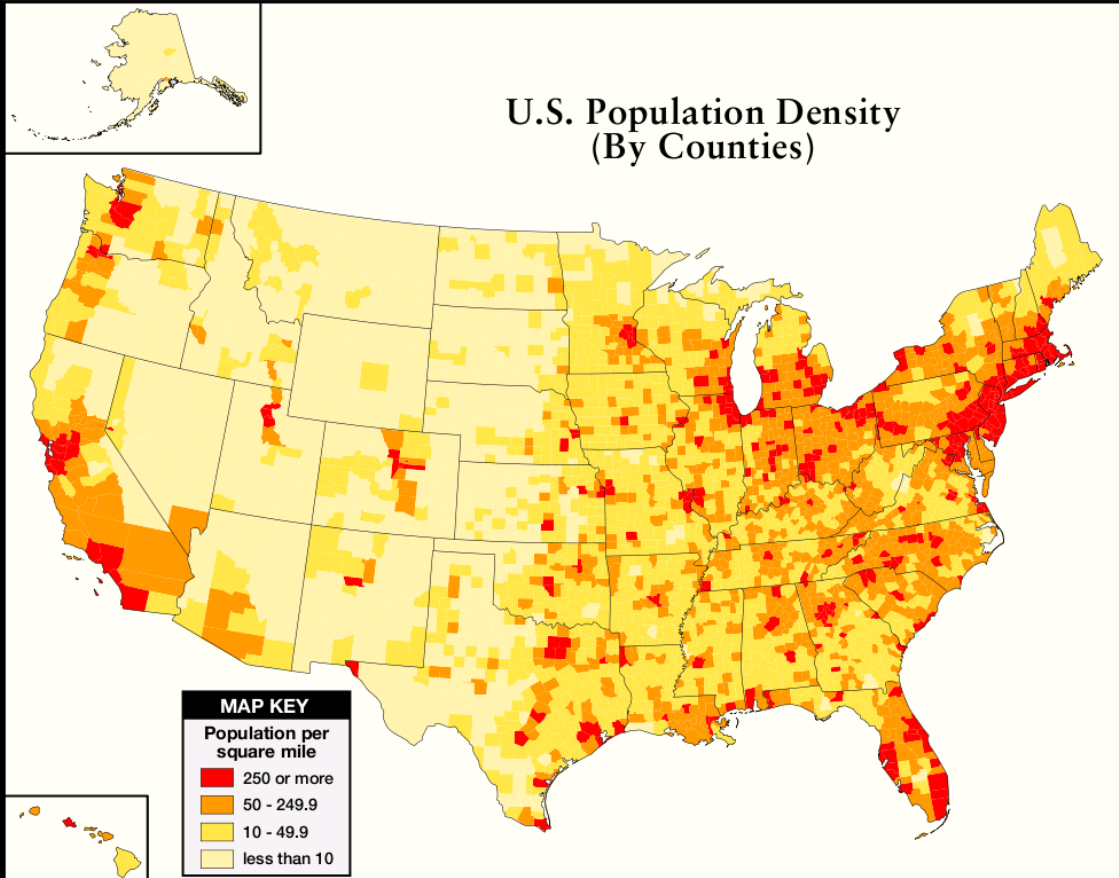

- The number of people per unit of land area.

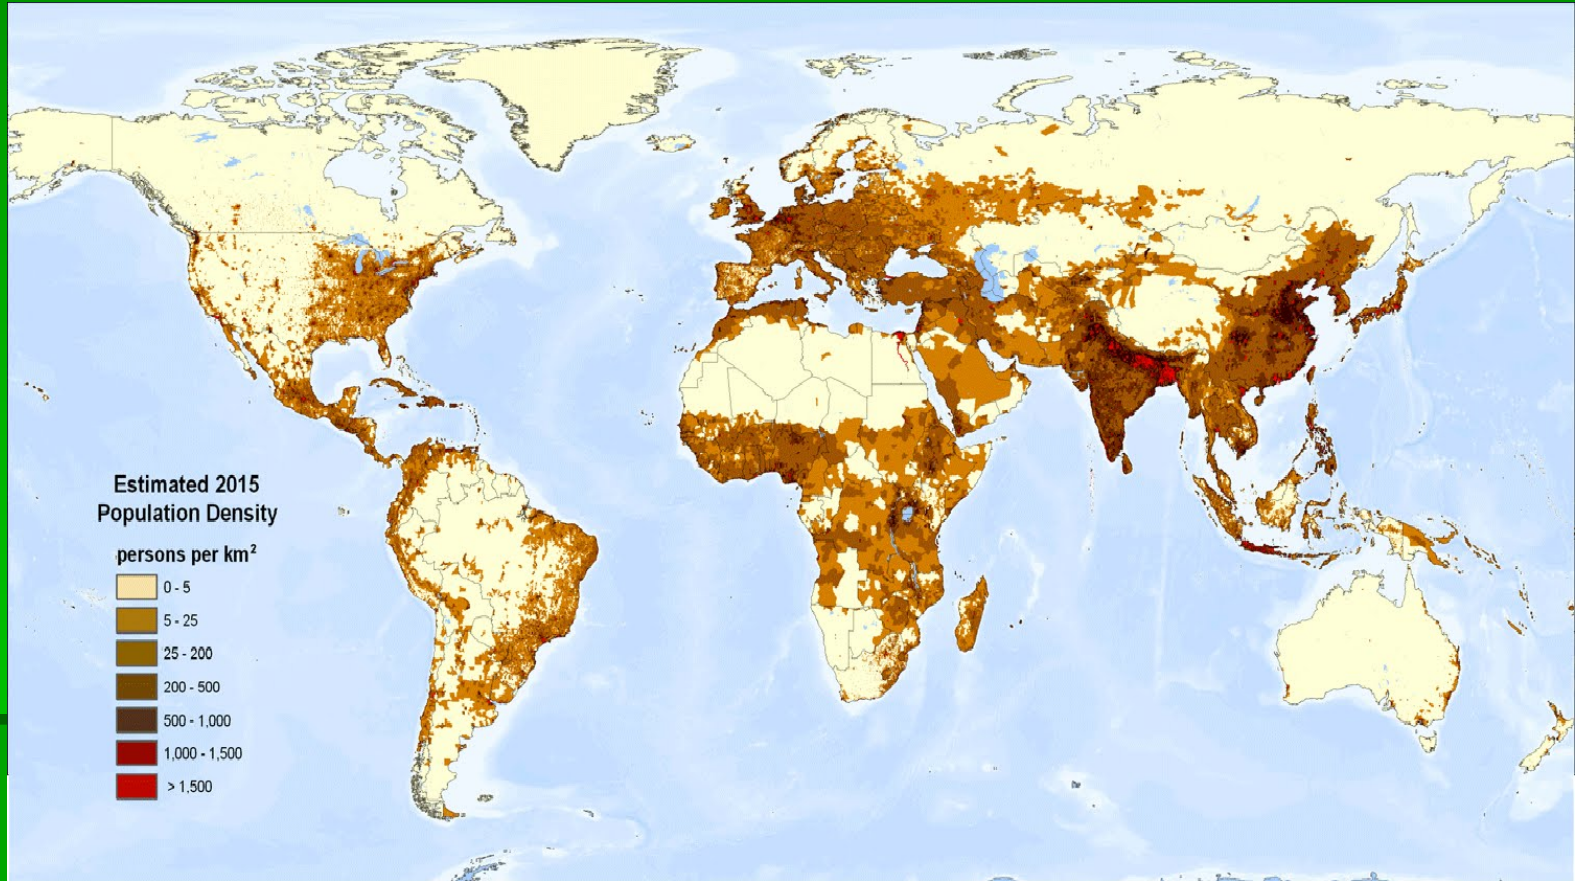

---

  - expressed as the number of people per square mile.
  - Describes how thickly settled an area is to compare different sizes and populations.

## U.S. Population Density (By Counties)

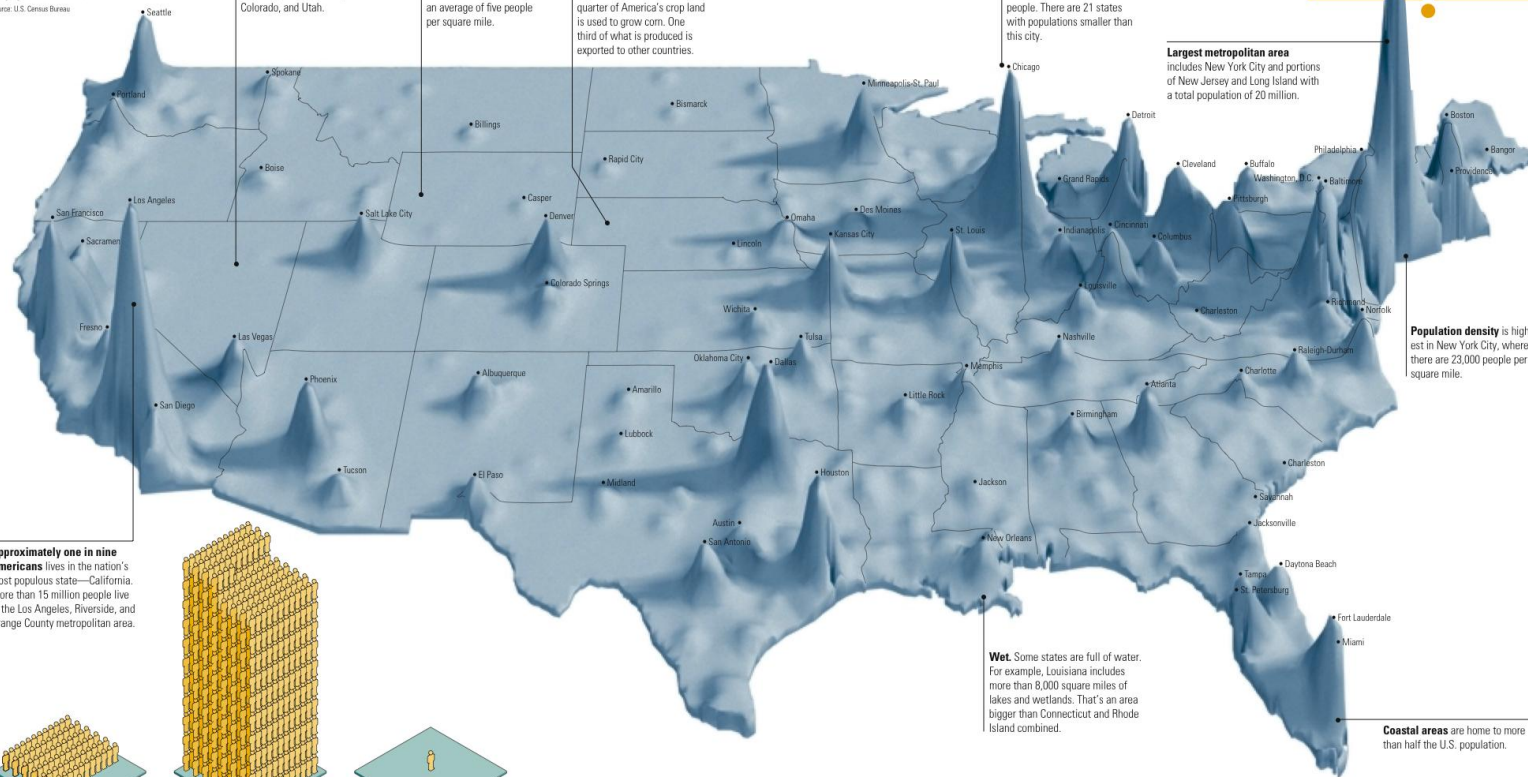

# Population Distribution

- Spreading of people over an area of land.
  - World population is spread unevenly.
    - i.e. Mumbai, India has the highest population density of any area in the world, 30,000 people per square kilometer.

**The population of the United States** is not distributed evenly. Instead, we tend to bunch up in communities, leaving the spaces in between more sparsely inhabited. Most Americans live in or near cities; today 53 percent live in the 20 largest cities. 75 percent of all Americans live in metropolitan areas.

**This map shows population density. The relative height of each major city reflects its population in 1990.**

Source: U.S. Census Bureau

## Population Distribution

Where do we live?  
Where don't we live?

**Go West.** Nevada is the fastest growing state, followed by Arizona, Idaho, Colorado, and Utah.

**Wyoming** has the lowest population density of all states in the lower 48 with an average of five people per square mile.

**What happens in the empty spaces?** Some of it is farming country. More than one quarter of America's crop land is used to grow corn. One third of what is produced is exported to other countries.

**Chicago, the country's third largest city,** has a population of about three million people. There are 21 states with populations smaller than this city.

**Largest metropolitan area** includes New York City and portions of New Jersey and Long Island with a total population of 20 million.

**Population density** is highest in New York City, where there are 23,000 people per square mile.

**Approximately one in nine Americans** lives in the nation's most populous state—California. More than 15 million people live in the Los Angeles, Riverside, and Orange County metropolitan area.

**Distributing our population evenly** would put an average of 76 people per square mile.

**New Jersey** is the most densely populated state with an average of more than 1,000 people per square mile.

**Alaska** is a sparsely populated state with an average of one person per square mile.

**Wet.** Some states are full of water. For example, Louisiana includes more than 8,000 square miles of lakes and wetlands. That's an area bigger than Connecticut and Rhode Island combined.

**Coastal areas** are home to more than half the U.S. population.

- What effects does a high population density have on a city?
